

Dear all,

Thank you for reading my paper. I plan to submit a future version of it to a sociology journal later this year. The paper is a first draft, so all criticism, including fundamental criticism, is welcome.

Suggested discussion questions:

- If the goal is to regulate the money market today, what “organizational, material, and cognitive equipment” is required? What can we learn from Minsky’s attempts about how to “redirect[] the flow of information” and form “coalitions across the science-state-society and lay-expert divides” (Eyal and Buchholz 2010, 130)?
- What is the relationship between policy devices (Eyal and Buchholz 2010, 128–133) and capitalism’s hardwiring?
- According to Ricks (2016), how do mainstream economists think about the money market?
- Why is it not double counting to count both repos and the MMF shares backed by them (Ricks 2016, 34)?
- What kind of boundary work could link the “technical” money market to “political” problems such as inflation and climate change?

Best,
Pierre
